What is ThyroSafe?

ThyroSafe (Potassium iodide) is a medication utilized in radiological emergencies, such as those events involving radioactive fallout (e.g. nuclear power plant failures, nuclear detonations).

Potassium iodide (KI) serves the purpose of protecting your thyroid in the event of such scenarios. It does this by covering your thyroid in iodine. This protects your thyroid from being penetrated by radioactive iodine, a byproduct of nuclear fission reactions.

If your thyroid is left defenseless against radioactive iodine, survivors may find that they experience issues later in life such as loss of function in the thyroid gland, the formation of nodules in the thyroid, and thyroid cancer.

Potassium iodide (KI) is only available as a medication in tablet form, and it is

leave out nuclear events as a possibility. It may be smaller than we think, or way bigger, which is why we chose to distribute ThyroSafe.

For more information on potassium iodide or ThyroSafe specifically, visit thyrosafe.com or check with your local health department.

*If you, your affinity group, mutual aid hub, or other initiative wishes to source ThyroSafe for distribution, we use MIRA Safety. **For those with this privilege, they do take FSA/HSA debit cards as payment for the medication.***

have the resources to construct fission bombs themselves, but many of their bibles (The Turner Diaries namely) fetishize nuclear holocaust. Food for thought when making your risk maps.

Even outside of the possibility of nuclear attack, but *could lack of EPA regulations lead to nuclear power plants failing?* Yes! Nuclear power stations have a history of failure and especially with Trump's attacks on the EPA, we can view frequent incidents as a possibility. Folks within 5 to 20 miles of a nuclear power plant already can receive free KI. Why not have more grassroots distribution? Why not have communities and individuals prepared for the possibility of wind carried fallout?

We aren't tunnel-blinded preppers who foresee apocalypse. Nor are we Adventists whom revel in the idea of Armageddon. We are anarchists that see infinite possibility and have a grasp of risk mapping. However, we also view that in many peoples' threat assessment, many do

advised that you take 1 dose per 24 hours following the occurrence of a radiological emergency. The dosage of 1 tablet per 24 hours should be continued until the risk is alleviated.

Besides the obvious implication that ThyroSafe does nothing for you if you are within the blast radius, there are a few other important things to know about its effectiveness:

- It is important to note that potassium iodide **WILL NOT** make you immune to radiation poisoning. It is only useful in guarding your thyroid from radiation.
- It is also only useful in the event of fission reactions and the subsequent fallout. Attacks utilizing dirty bombs (conventional explosives containing radioactive material) do not rely on nuclear fission and as such, radioiodine is not a byproduct of those detonations.
- Children and those who are not pregnant

below the age of 40 should be prioritized in the administration of potassium iodide, as the thyroid is not fully developed and radiation damage may cause hormonal and developmental complications.

Why Do We Distribute ThyroSafe?

Our distro has stocked ThyroSafe since the first few months of the second Donald Trump presidency in the so-called US. We had discussed amongst our group distributing ThyroSafe on and off for months before, but it remained merely casual dialogue. The idea was taken into serious consideration the evening of February 28th, 2025 following the hostile interactions between Donald Trump, JD Vance, and Volodymyr Zelenskyy wherein a plethora of concerning comments were thrown around that made us feel the weight of the current international climate.

Some may not share in this concern, and

we see the motivations to view a global nuclear exchange as an impossibility. However, we believe it is always good to be a little paranoid and we did view this as a sign that such an event is arguably closer than it was in the 60s.

We are entering an era of Rome's fall, and with that comes deep domestic and international instability. The future is always uncertain, but the pot is boiling in the present!

Could a nuclear exchange between sovereign power manifestations commence? Sure, the threat has been there since 1945. There have been nuclear cold wars in the past and it is possible we enter another.

Could white supremacist groups utilize fission bombs? Absolutely, it is already a known fact that white power groups have the capacity for constructing dirty bombs. Why wouldn't fission bombs be something to worry about? They may not
